#### Explanatory.

Aphelion—The point of a Planet's orbit farthest from the Sun.

Apczee—That part of the Moon's orbit farthest from the Earth. Astronomical Day is reckoned from noon to noon through the 24 hours. Thus, July 21, 9h, is 9h A of July 21, and July 21, 15h, is 3h M of July 22.

Conjunction—A Planet directly between the Earth and the Sun is said to be in Inferior Conjunction with the Sun. A Planet with the Sun directly between it and the Earth is said to be in Superior Conjunction with the Sun. Planets are said to be in conjunction with each other, or with the Moon, when they are in the same sign and degree.

Declination—The distance of a heavenly body from the Equinoctial, measured north or south, in degrees or minutes, on a Meridian.

Ediptic—The plane of the Earth's orbit, so called because Eclipses can take place only when the Moon is on or near it.

**Elong**ation—The distance of a Planet from the Sun as seen from the Earth.

Equinoctial—The circle in the heavens traced by the Earth's Equator.

me at St. Jo Node—That part of the orbit of a heavenly body which intersects the Ecliptic. If the body is passing from south to north, it is called the Ascending Node; if from north to south, Descending.

mean timeOpposition—A Planet with the Earth directly between it and the Sun is said

Penumbra—That portion of space around the shadow of the Earth, in passing through which the Moon diminishes in brightness, in consequence of a part only of the Sun's rays reaching her surface.

'erigee—That part of the Moon's Orbit nearest to the Earth.

ohn, in Long erificion-That part of a Planet's Orbit nearest to the Sun.

uadrature—Two heavenly bodies are said to be in Quadrature when they are mean time distant from each other by one-fourth of the Zodiac, or three signs apart. e 51° 44′ S. he Sun's Declination and fast or slow of clock are given for apparent noon, or time of passing the Meridian of St. John.

The Moon's Southing is given in Astronomical time for the Meridian passage at St. John; and her Declination, when on the Meridian. The Rising of the Moon is given from Full Moon to New Moon; and the Setting from New Moon to Full Moon.

The Tides in the Calendar are the Morning and Afternoon Tides at St. John and Charlottetown. In the Tide Table (page 37) will be found Constants for finding the time of High Water at each of the places given in the Table. In editions of this Almanac prior to 1885 the Tides were only given approximately, but ever since they have been corrected for the varying distance of the Moon from the Earth, and also her angular distance from the Sun They can now be depended on as accurate to at least the same degree as the

It will sometimes be found that when a Constant is added to the time of High Water at the Port of reference the sum exceeds 12 hours; in this case Admiralty Tide Tables. subtract 12 hours from the sum and the remainder will be the time of High Water at the required Port on the succeeding afternoon or morning, according as the Tide at Port of reference was a Morning or Afternoon Tide.

If an observer could obtain, at regular and repeated intervals, readings of the Barometer at stations distributed over a large area, he would be enabled to trace the march of the storm, for it has been found that the wind always blows towards the place of the lowest barometer reading; and so, by means of the telegraph, he may warn those places the storm is approaching. mistakes are often made, and the forecasts are not always infallible, so that much remains to be done before meteorology can be ranked among the exact sciences.

#### Time Ball on Northern Tower of Custom House.

The Ball will be hoisted half its elevation each day (Sunday excepted) at fifteen minutes before one o'clock. At one minute before one o'clock it will be hoisted its full length; and at one o'clock, mean time, the Ball will be dropped. A Chronometer keeping correct Greenwich time should then show 5h 24m 15s, and the difference between this and the time shown by a Chronometer, is its true error on Greenwich time at the moment. As the above hour of one o'clock when the Ball drops, represents 5h 24m 15s at Greenwich, the error of a Chronometer may be ascertained, no matter where the ship is lying Masters of vessels arriving at Saint John should compare their Chronometer by the time Ball, as it will enable them to get the sea rate, which frequently varies from harbour rates. Latitute 45° 16′ 42″ North. Longitude in time 4h 24m 15s West of Greenwich.
